The present invention relates to the isolation of novel human enzyme completes, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the classorders including hyperproliferative disorders (e.g. cancer), communodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. carcer), communodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AIzheimer's disease), cometabolic disorders (e.g. phenylketconuria), inflammatory disorders (e.g. arthritis), cardiovascular disorders (e.g. atherosclerosis), cometabolic disorders (e.g. henylketconuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis). The blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The colymnic polymnic polymnic polympitides of the invention can also be used in gene therapy.

AND22915-AAUZ3814 represent the novel human enzyme polypeptides of the

                                                                                                                                                                                                                                       metabolic disorders (e.g. phenylketonuria), including the control of the invention can also be used in gene therapy.
                                                                                                                                                                                                                                                                                              The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders: (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AIDE) autoimmune disorders (e.g. phenylketonuria), inflammatory disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      05-DEC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DB seq

"CDNA cloning of indole-3-acetic acid regulated gene
from mung bean (vigna radiata) hypocotyl tissue.";

Plant Cell Physiol. 33:93-97(1992).

-! FUNCTION: COULD ACT AS REGULATOR OF GENES RESPON
MEDIATING THE VARIOUS AUXIN-INDUCED EVENTS RESPON
GROWTH (BY SIMILARITY).

-! SUBCELLULAR LOCATION: Nuclear (By similarity).

-! DEVELOPMENTAL STAGE: FOUND IN ELONGATING HYPOCOT
-! INDUCTION: BY AUXIN AND CYCLOHEXINIDE.

-! SIMILARITY: BELONGS TO THE AUX/IAA FAMILY.

SUMMARIES

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                В
                                                                                                                                                                                             Š
                                                                                                                                                                                                                                                                                                                                                 The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The CC invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

Note: The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic

The polypeptide and nucleic acid can be used to produce vaccines which can be used to protect animals against different members of the coronavirus family. e.g. feline infectious peritonitis virus, feline enteric coronavirus; canine coronavirus, swine transmissable gastroenteritis coronavirus; bovine coronavirus; human coronavirus

  The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the

insecticides, therapeutics and pharmaceutical drugs. The Invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                  The invention relates to an isolated nucleic acid detection reagencepable of detecting 1000 or more genes from Drosophila. The inventueful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast
                                                                                                                                                                 Disclosure;

The nucleic acids have antiviral activity and can be used in gene therapy. They are useful for the treatment of papilloma or hepatitis virus induced conditions and can produce a cytotoxic or cytostatic effect in papillomavirus or hepatitis infected cells. The papilloma virus induced condition is selected from warts, cervical dysplasia, cervical carcinoma, carcinoma in situ and

                                                                                                                                              Vector pDS56/RBSII, 6xHis is a derivative of pDS56/RBS (EP-282042). It comprises an additional sequence encoding six histidine residues. Into this vector may be ligated a 1400 bp AseI fragment of NXY (see AAQ13727) to yield pDS-NXY. E. coli Sc13009 (pUBAI) transformed with pDS-NXY produces a 69 kD fusion protein comprising the NXY fragment N-terminally linked to an affinity peptide contg. 6 His units, and C-terminally to a vector-derived sequence. Fragment B corresponds to amino acids 1-462 of the N-terminal of the antigen. The affinity peptide is used for the purification of the antigen. The polypeptide is useful for the produced of the antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   P. falciparum sporozoite antigen

rulypeptides corresp. in at least one specific epitope with the P. falciparum sporozoite are useful in the prodn. of antimalarial vaccines. The N-terminal has a mol.wt. of 81.281, the total protein has a mol.wt. above 200 kD. Potential glycosylation sites are at position 32, 260, 308, 323, 329, 344, 362, 365, 377, 380, 387, 388, 394, 398, 399, 406, 414, 537, 554, 659, 684, 693, 702, and 705. See also AAQ13728.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antimalarial polypeptide(s) - corresp. to specific epitope(s) of the Plasmodium falciparum sporozoite antigen, and are useful as vaccines or to prepare antigens

The protein, homologs and analogs of the invention can be used as a novel approach to developing drugs useful for the treatment of jelly fish stings, pharmaceuticals with blood platelet agglutination activity, pesticides by use of the hemolytic activity, and in the study of the hemolytic mechanism. AAY33648-Y33650 represent fragments of the hemolytic protein described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    06-JAN-2000

                                                                                                                                                                                                       Monoclonal antibodies that specifically recognise any of these foam proteins are used in immunoassays (preferably ELISAs) for determining the foam protein content of beer during brewing, for determining the head retention or head retention stability of beer, for evaluating raw materials for beer making, and for selecting stabilisers (preferably silica gel or tannic acid) for beer. The immunoassays allow investigation of raw materials and stability during fermentation rathe than after and they are an improvement on prior art assays involving polyclonal antibodies and allow detection of minute amounts of ingredient-specific foam proteins.
                                                                                                                                                                                                                                                                                                                                                                                                          Sequences shown in AAW75903 to AAW75908 are novel foam proteins with molecular weight between 40-48 kD, as determined by Western blot analysis. These foam proteins are crucial for beer head retention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       04-DEC-1997;

ALIGNMENTS

Protein with hemolytic activity, useful for drugs treating jelly fish stings, pharmaceuticals with blood platelet agglutination activity, pesticides by use of the hemolytic activity, and study of the hemolytic mechanism mechanism 01-APR-1998; Carybdea rastonii. Nagai H, (SUNR) SUNTORY LTD. 30-MAR-1999; 07-OCT-1999. WO9950294-Al 1999-580740/49. Nakajima T; 98JP-0088569 99WO-JP01607

Hemolytic protein; blood platelet agglutination; drug development; treatment; sting; jellyfish; pharmaceutical; pesticide.

C. rastonii hemolytic protein derived peptide 2.

06-JAN-2000

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 seq length: 0 seq length: 2000000000
